

Individual discussion, Ali Alladin – Week 3

What do I want to learn or understand better?

We have decided that we will start working with kpi:s from the next sprint and I will try to refresh my memory about them since I know generally what they are but it would be good to more specifically know about some specific ones and find some that might be suitable for us. The best way to do this will probably be to watch lecture about kpi:s. When it comes to the technical part, working with Spring I am still no expert but understand the very basics by now. I will still have the same approach when it comes to get a better understanding of Spring as last week.

How can I help someone else, or the entire team, to learn something new?

We did in the beginning of the week have a session where we set up everything technical, e.g., ide, shell-project and git. During this session I tried to share the knowledge I had with the other members regarding the tools I had used before. Just like the previous weeks I tried to share a couple of tutorials I found helpful with the group. Other than that I pushed some code I wrote when trying to learn a bit more about spring so that the rest of the group could take part of it and play a bit with it.

What is my contribution towards the team's use of Scrum?

The project has finally started, and the first sprint is done. In the beginning of the week we had a meeting with our stakeholder, and one with our supervisor. After these meetings we planned the first sprint accordingly by updating our scrum-board and decided which of the user stories we will work with and when. At the end of the week we did a sprint review where we discussed how the sprint went (can be found in team reflection). One thing we decided was that we should define more specific roles for each team member in the next sprint and since I have previous experience of html and java I might take a role as a developer but I would also be interested in trying other roles where I get to work with the design, architecture or even a more "administrative" role. The above mentioned activities were all done in group and I participated in all of them.

What is my contribution towards the team's deliveries?

The team delivery for this week was to complete user story 1, a very basic web application where work shifts can be added through a form and the displayed in a list. I have during all the sessions where we have worked with the different tasks contributed by coding. Another delivery for this week was the first team reflection which we wrote at the end of the week and which I was a part of.
